

FLOW AGENT AS 2.0

Recursive, Persistent Execution Engine.

TransformBy10X · Private Operator System. Powered by Hermes, Agent Zero, and OpenClaw. Operator's Manual.

Overcoming the AI Operator Bottleneck

Most AI tools require you to do the work. **FLOW AS** makes the **agents** do it.

THE PROBLEM

Fragmentation: Disconnected tools with no shared memory or coordination.

Repetition: Context must be re-explained and re-prompted for each task.

Bottleneck: Humans become the single point of failure for progress.

THE FLOW SOLUTION

FLOW acts as a persistent, governed OS that routes, executes, and learns—shifting your focus entirely to decisions, not operations.

An Autonomous Operating System, Not a Chatbot

CHATBOT

Manual Input Loop

OPERATING SYSTEM

RECEIVES: Tasks via structured envelope (form, JSON, or LLM-generated).

ROUTES: Intelligent distribution based on risk, type, and capability.

EXECUTES: 24/7 operation across three specialist agent lanes.

LEARNS: Automated reflection and skill extraction after every job.

PERSISTS: Permanent, structured memory in file and database architecture.

The Macro Architecture: From Intent to Artifact

A single, governed flow from your instruction to a completed, persistent artifact.

Step 1: The Task Envelope (The Operator Contract)

The structured contract between your intent and the agents' execution. Validated before queueing.

Step 2: Intelligent Model Routing

The OS dynamically selects the optimal model for every job.

Step 3: Execution via The Three Specialist Agents

 **Hermes (v0.20.0)** 

Role: Governed Executor

Queue: ALPHA

Best For: Content, copy, structured docs, brand assets.

Governance: Strict (Cannot deploy to prod, mutate databases, or redefine canon).

 **OpenClaw (v2026.7.1)** 

Role: Fast Classifier

Queue: BETA

Best For: Verification, classification, quick checks.

Governance: Low-latency optimized.

 **Agent Zero (v2.8)** 

Role: Unconstrained Solver

Queue: GAMMA

Best For: Code, implementation, research, system tasks.

Governance: Full Linux container access.

Step 4: Governance via The Brand Canon

A structured, read-only knowledge base injected into every agent container.
No agent can redefine brand canon.

TOP RIGHT BLADE

00_CANON: Non-negotiable principles (MUST: Mirror, Understand, Solve, Transform).

SECOND BLADE

01_CUSTOMER_PSYCHOLOGY: Lived experience & customer research.

THIRD BLADE

02_BRANDS: Boundaries for TBTX, BizBuilders, BizBot, CARE, FLOW AS.

FOURTH BLADE

03_PRODUCTS: Program architecture & product definitions.

FIFTH BLADE

04_COPY_SYSTEM: Repeatable rules for customer-facing assets.

SIXTH BLADE

05_PROMPTS: Controlled templates for AI production.

BOTTOM BLADE

06_EXECUTION: Intake, approval, and release operations.

Step 5: The Recursive Learning Loop

The system gets smarter, faster, and more aligned with every completed task.

1. Creates a Reflection

A structured analysis is generated dissecting what worked, what failed, and what was learned during execution.

2. Triggers a Learning Cycle

The reflection is processed and committed as a permanent skill/memory update.

3. Updates Agent Context

Future tasks automatically inherit this prior experience, lowering error rates without manual re-prompting.

Step 6: File Architecture & Persistence

Every output has a home. Nothing is ever lost.

- ✓ All outputs, reviews, and memory states are permanently written to a structured file structured file and database architecture.
- ✓ Strictly organized by **Job ID**, **Date**, and **Task Type**.
- ✓ Direct dashboard access enables instant file browsing and artifact downloads at any time.

The Engine Room: Infrastructure Snapshot

A production-grade, always-on, self-healing stack terminating at flow.srv1863070.hstgr.cloud

VPS:	Hostinger KVM (16 vCPU, 15.6 GB RAM) - LIVE
Reverse Proxy:	Traefik (HTTPS, auto-TLS) - LIVE
Orchestrator:	BizBrain Lite (FastAPI) - LIVE
Job Queue:	Redis 7.2 (Append-only) - LIVE
State Database:	Postgres 17 + pgvector - LIVE
Dashboard:	React + Vite + TailwindCSS - LIVE

Resilience Note: Auto-healing architecture. All containers run on a strict `restart: unless-stopped` policy, automatically recovering upon VPS reboot.

The Forward Roadmap

Improved Task Intake

LLM-assisted form, JSON upload, and bulk submissions.

Queue Management

Bulk approvals, rejections, comments, and priority reordering.

File Browser UI

Deep navigation organized by project, brand, date, and type.

Campaign Templates

Pre-built task envelopes for executing common brand workflows instantly.

Webhook Triggers

Autonomous task creation fired by external events (Notion, Slack, GitHub).

Agent Zero Integration

Transitioning to erikhinla/agent-zero as the canonical fork with FLOW customizations.

The Leverage Equation

**1 Operator + FLOW OS =
A 24/7 Operations Team**

- Submit campaign briefs at midnight; wake up to complete, brand-aligned drafts.
- Execute up to 10 massive tasks in parallel across three specialized agents simultaneously.
- Build an institutional memory that never sleeps, never forgets, and actively learns from your approvals.

FLOW Agent AS 2.0 is not a tool you use. It is a system that works for you.
